

MAJOR IN SOIL AND CROP SCIENCES, PLANT BIOTECHNOLOGY CONCENTRATION

Crop improvement, whether through breeding or genetic engineering, is one of the most important drivers of agricultural innovation. Students with a major in Soil and Crop Sciences in the Plant Biotechnology Concentration gain a firm foundation in fundamental principles of genetics and crop breeding and explore new and rapidly evolving technologies that enable us to develop crop varieties that are more nutritious, resilient to climate change, and disease resistant.

Career opportunities are available in both the public and private sectors, including basic research, plant breeding, product development, and sales.
